## Executive Summary

Nationwide, across a variety of professions, research suggests a "narrowing, but persistent" gap in pay between men and women. ${ }^{1}$ While the contributing factors are more complex than gender alone, the Association of Fundraising Professionals (AFP) recognized the opportunity to use its repository of more than 10,000 responses to its compensation and benefits survey to analyze the relationships between gender and compensation, and other factors and compensation, in the fundraising profession.

The AFP Compensation and Benefits Study has been conducted for 18 years and provides analysis and conclusions on fundraiser compensation, benefits, and aspects of career satisfaction. ${ }^{2}$ This report relies on the most recent five years of survey data from respondents working at least three-quarters time ( 0.75 full-time equivalent) in the United States, more than 10,000 responses collected between 2014 and 2018. It examines the relationship between gender and salary to answer the primary research question:

When controlling for other factors, to what extent does gender predict differences in annual income for fundraising professionals?

## Summary of Findings

## The fundraising profession suffers from a gender pay gap; controlling for other factors, a fundraiser who is a woman can expect to make about 10 percent less than her male counterparts.

The field is doing slightly better than the national average, but women in fundraising can expect to make 10 percent less than men. (A 2018 report from the Pew Research Center found that, on average, working women nationwide make 84 percent as much as men.) The Pew research acknowledged other factors that contribute to gender pay inequities beyond gender itself: years of experience, educational attainment, occupational differences, and other "negative factors" taking time off to care for children or other family members or otherwise interrupting a career for family obligations. ${ }^{3}$

These and other factors impact salary differences in the fundraising profession as well. In line with expectations, fundraisers earn higher salaries when they work for organizations with large budgets, hold high-level positions, and hold advanced degrees. A larger share of male than female fundraisers, however, comprise these favored groups. Of survey respondents:

## 42 percent of men work in an organization with a budget of $\$ 10$ million or more, compared with one-third of women.

Working in an organization with a budget of $\$ 50$ million or more is associated with a 53.7 percent increase in annual salary, and working in a budget of $\$ 10$ to $\$ 49.9$ million is associated with a 31 percent increase in annual salary, compared with organizations with budgets of less than $\$ 1$ million.

[^0]Nearly 60 percent of men hold a high-level position, compared with 52.5 percent of women.
Employment as a CEO, CDO, Vice President, or Director of Fundraising is associated with a 25.3 percent increase in salary, compared to Program Director, Department Director, and Fundraising Officer.
More than half of men hold a master's, doctorate, or professional degree ( 52.3 percent), compared with 42.5 percent of women.
Holding a professional or advanced degree is associated with a 15.5 percent increase in annual salary compared with Bachelor degree holders.
In addition, "negative factors" contribute to a 5.7 percent decrease in pay, consistent with the notion that taking time off work to care for family or otherwise stop out of the workforce results in lower salaries when all other factors are equal.

Just 15 percent of men reported experiencing one or more negative factors, compared with more than a quarter of women ( 25.7 percent). The gap between men and women experiencing specific negative factors was largest for taking time off to care for a child (1.1 percent of men and 11.2 percent of women) and relocating for a spouse (4.2 percent of men and 8.8 percent of women).
Experiencing one or more negative factors is associated with a 5.7 percent decrease in salary.
While it may be unsurprising that fundraising salaries are higher at very large organizations, for high-level positions, and for fundraisers with advanced degrees, the fact that gender contributed to a 10 percent decrease in salary for women is not trivial. Gender contributed to the model more than organizational budget size of $\$ 1-\$ 3$ million (compared to organizational budget size of less than $\$ 1$ million), more than holding a Master's degree (compared to a Bachelor's degree), and more than having experienced one or more negative factors (compared to not). More women than men take time off for childcare, a smaller proportion hold high-level positions, and a smaller proportion hold fundraising positions in the largest organizations.

## Still, independent of these and other variables, the profession is faced with the reality that women in fundraising are paid less than men.

The steps required to remedy this disparity are beyond the scope of this report; however, awareness of the data, acknowledgement of the responsibility within the profession and among hiring managers to close gender-based gaps, and an active commitment to equity may shift the culture in fundraising and result in differences in pay based only on differences in merit.

## Introduction

The Association of Fundraising Professionals (AFP) Compensation and Benefits Study has been conducted for 18 years and is intended to answer questions related to fundraiser compensation, benefits, and aspects of career satisfaction. The survey instrument is developed by AFP Research Staff and reviewed by a volunteer panel of experienced researchers. All active members with email addresses are polled each year.
Survey results for each year are compiled and analyzed in separate reports (available on the AFP website free to members, and for a fee to non-members). The purpose of this report is not to provide data from individual surveys; instead, the focus is on the past five years of data, 2014 through 2018. This report focuses only on U.S.-based data. ${ }^{4}$ In particular, this report aims to answer the primary question of the extent to which various predictor variables may contribute to differences in annual income. Specifically:

When controlling for other factors, to what extent does gender predict differences in annual income for fundraising professionals?
In addition to this primary question, the report provides aggregated information across the past five years, in total and trends, for other factors that may relate to annual income and overall career satisfaction for fundraising professionals.

This report is organized into three main sections:
Section 1. Fundraising Salaries by Gender and Other Predictors presents the results of a regression model that holds constant other factors that contribute to salary differences. It discusses trends in these factors over time.

Section 2. Differences in Other Circumstances and Perceptions presents the differences in men's and women's responses to a series of questions related to career circumstances and perceptions.

Section 3. Conclusion summarizes the conclusions that can be drawn from the analysis.

Methodology and limitations to the analysis are discussed in Appendix A.

[^1]
## Section 1.

Fundraising Salaries by Gender and Other Predictors

## Factors Contributing to Salary Differences

In 2018, the Pew Research Center reconfirmed the "narrowing, but persistent" gap in pay between men and women. This research found women across all industries earn 84 cents for every dollar a man earns. Beyond gender itself, the Pew research discussed factors that may, in part, explain the difference: years of experience, educational attainment, occupational differences, and other "negative factors" - taking time off to care for children or other family members or otherwise interrupting a career for family obligations. ${ }^{5}$
Pay gaps vary across industries and roles. For example, among lawyers who graduated in 1984, women with similar traits and in similar jobs earned 11 percent less than their male peers. ${ }^{6}$ The gap for female hospital CEOs in 2015, however, was twice that; they earned 22.6 percent less than their male peers, after taking into account the hospital location, size and other factors. ${ }^{7}$ For professional fundraisers, scholars at the IU Lilly Family School of Philanthropy examined gender and pay using data from the AFP Compensation \& Benefit Surveys for 2000 through 2005. Men were paid more, were more likely to work for larger organizations, and raised more funds in total. After taking these and other factors into account, women were paid 11 percent less than men. ${ }^{8}$

This paper uses a similar approach and examines numerous independent variables that may contribute to differences in salary: race/ethnicity, organizational budget (as a proxy for organizational size and complexity), geographic region, and year of response. The data are from the 2013 through 2017 AFP Compensation \& Benefits survey.

> Fundraisers who are women, however, can still expect to make 10 percent less than men, even after controlling for education level, years of experience, position level, race/ethnicity, organizational budget, region, family factors, and response year.

The impact of each factor on salary differences is discussed in the following section, and descriptive analyses of other predictors of salary differences are provided in Trends in Contributing Factors.

[^2]
## Predicting Salary Differences by Gender and Other Factors

A linear regression was conducted to analyze the extent to which various predictors may contribute to annual salary for fundraising professionals participating in the survey each year (2014-2018). Of particular interest was the extent to which, holding other factors constant, gender contributes to salary differences for survey respondents.

As shown in Figures 1 and 2, although survey respondents were predominantly female (women comprised 77 percent of responses across all years, and between 77 and 81.5 percent of responses in given years), across all years, male respondents reported higher median and mean salaries than female respondents. On average across 2014-2018, male respondents' mean salaries were over \$20,500 higher than female respondents' salaries, and median salaries for males were about $\$ 15,400$ higher.

Figure 1: Mean Salary by Gender by Year

Figure 2: Median Salary by Gender by Year

Based on analysis of various potential contributing factors (descriptive analyses coupled with review of the literature, as well as preliminary analyses with sensitivity tests), predictor variables selected for the analyses included gender, race, whether the respondent had experienced any
negative factors (such as leaving the workforce to care for children), years of experience as a fundraising professional, year of response (to control for potential inflation changes), organizational budget (to account for organizational size), region (to account for differences in regional pay and cost of living), current position, and education level. Annual salary was the outcome variable. 9 Table 1 shows the results of the regression for select variables. The percent difference in annual salary column in the table represents the transformation of the coefficients to show the impact on salary, rather than showing log of salary, to facilitate interpretation of the results.

As shown in Table 1, though it was not the strongest indicator of differences in annual salary, gender was a statistically significant predictor of annual salary. If a respondent was female, her salary decreased by 10 percent, even when controlling for other predictor variables.
Six predictor factors contributed more toward annual salary than gender. The leading two factors were related to large organizational budgets-working for an organization with a budget of $\$ 50$ million or more (i.e., the highest budgets) represented a salary increase of 54 percent (as compared to those working for organizations with less than $\$ 1$ million) and working for an organization with $\$ 10-\$ 50$ million represented an increase of 31 percent. An organizational budget of \$3-4 million accounted for an increase of 18 percent in annual salary.

Current position also contributed significantly to annual salary-holding positions of CEO, CDO, VP, or Director of Fundraising represented a salary increase of 25 percent (compared to those at the Program Director, Deputy Director, or Fundraising Officer level), while holding some other fundraising position represented a salary decrease of 20 percent. Finally, holding a doctoral or professional degree represented a salary increase of 15.5 percent (compared to those with Bachelor's degrees only).

[^3]Table 1a: Summary of Linear Regression Analysis: Select Variables ${ }^{10}$

| Predictor Variable | Slope of the Line/ <br> Relationship | Avg. <br> Distance of Points from the Regression Line | \% Difference in Annual Salary (vs. other group) | Sig. |
| :---: | :---: | :---: | :---: | :---: |

| Negative impact (any, compared to none) | -0.06 | 0.01 | -5.7\% | <. 01 |

## Trends in Contributing Factors

This section analyzes differences in mean and median salary on variables beyond gender alone that may be predictors of salary for fundraising professionals. ${ }^{11}$ Table 1 provides information about total number of respondents and respondents by gender.

As Table 2 shows, the vast majority of respondents in any year were female, representing 77 percent of responses when combining across all years, and never less than 72 percent of responses in any year.

[^5]Table 2: Response Counts by Gender

|  | Total <br> respondents |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Year | Total Male | Total Female |  | Total Unknown/ <br> Other Gender |
| 2014 | 2,652 | 598 | 2,032 | 22 |
| 2015 | 1,599 | 337 | 1,251 | 11 |
| 2016 | 2,176 | 422 | 1,738 | 16 |
| 2017 | 1,589 | 292 | 1,289 | 8 |
| 2018 | 2,612 | 467 | 1,894 | 251 |
| TOTAL | $\mathbf{1 0 , 6 2 8}$ | $\mathbf{2 , 1 1 6}$ | $\mathbf{8 , 2 0 4}$ | $\mathbf{3 0 8}$ |

Because the primary purpose of this report is to examine differences in salary, Table 3 identifies the number of responses in which salary data were not reported or salary responses were not included in salary analyses. ${ }^{13}$ The vast majority of responses included salary information (98 percent or more in each year).
Table 3: Response Counts: Salary Data

| Year | Total respondents | With Salary Data | \% With Salary Data | Missing/ Outlier Salary Data | \% Missing Salary Data |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2014 | 2,652 | 2,640 | 99.5\% | 12 | 0.5\% |
| 2015 | 1,599 | 1,587 | 99.2\% | 12 | 0.8\% |
| 2016 | 2,176 | 2,167 | 99.6\% | 9 | 0.4\% |
| 2017 | 1,589 | 1,577 | 99.2\% | 12 | 0.8\% |
| 2018 | 2,612 | 2,572 | 98.5\% | 40 | 1.5\% |
| TOTAL | 10,628 | 10,543 | 99.2\% | 85 | 0.8\% |

## Organizational budget

As shown in the regression results in the previous section, organizational budget has a statistically significant effect on salary level. Fundraisers working in organizations with larger budgets tended to have larger annual incomes than those in smaller organizations; as shown in Table 4, mean and median salary rose as organizational budget rose. Those working in organizations with budgets of $\$ 50$ million or more had a mean salary of over $\$ 100,000$ and a mean of $\$ 86,000$, by far the largest of all respondents. Conversely, those working in organizations with budgets of less than $\$ 1,000,000$ had the lowest mean and median salaries across all years.

[^6]Table 4: Salary by Organizational Budget (2014-2018)

| Org. Budget ${ }^{14}$ | Total respondents | Mean Salary | Median Salary |
| :---: | :---: | :---: | :---: |
| Less than \$1,000,000 | 1,951 | \$65,555 | \$57,500 |
| \$1,000,000 to \$2,999,999 | 2,136 | \$67,846 | \$60,000 |
| \$3,000,000 to \$9,999,999 | 2,379 | \$74,156 | \$67,000 |
| \$10,000,000 to \$49,999,999 | 2,255 | \$84,484 | \$75,000 |
| \$50,000,000 or more | 1,251 | \$102,604 | \$86,000 |

As Figure 3 shows, much like years of experience, those working in organizations with budgets of $\$ 10$ million or more earned higher median salaries across all years. While those in organizations with budgets of less than $\$ 1$ million had the lowest median salaries across all years, they were roughly similar to those in organizations with budgets of $\$ 1$ million to \$2,999,999 million.

Figure 3: Median Salary by Organizational Budget

| \$100,000 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \$80,000 $\quad$ - $<1$ mill |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
| \$40,000 $\quad$ - 10 mill to 49.999 mill |  |  |  |  |  |  |
| \$20,000 All respondents |  |  |  |  |  |  |
| $\begin{array}{lllll}\text { \$0 } & 2014 & 2015 & 2016 & 2017\end{array}$ |  |  |  |  |  |  |

Male respondents were more likely than female respondents to report working for organizations with larger budgets ( $\$ 10$ million or more), with 42 percent working in such organizations, compared to only one-third of female respondents. Conversely, 20 percent of female respondents reported working in organizations with budgets of less than $\$ 1$ million, compared to 17.5 percent of male respondents. ${ }^{15}$, 16

[^7]Table 5: Organizational Budget by Gender

## Education level

Like organizational budget, education level has a statistically significant effect on salary. When combining data across all years of the survey (2014-2018), respondents' mean salary tended to increase as education level increased, increasing from $\$ 67,208$ for respondents whose highest education level was high school diploma, to more than $\$ 90,000$ for fundraisers with a doctoral or professional degree. Median salary followed the same pattern. See Table 6.

Table 6: Salary by Education Level (2014-2018)

| Education Level ${ }^{17}$ | Total respondents | Mean Salary | Median Salary |
| :---: | :---: | :---: | :---: |
| Associate or Less | 564 | \$67,208 | \$60,000 |
| Bachelor's Degree | 4,172 | \$72,536 | \$62.500 |
| Master's Degree | 5,011 | \$81,384 | \$71,000 |
| Doctoral/professional Degree | 442 | \$92,291 | \$79,650 |

Respondents with Master's degrees and above tended to have higher median salaries than the median of all respondents, and respondents with doctoral or professional degrees had the highest median salaries across all years. Median salaries for respondents with doctoral and professional degrees varied more across years than at other education levels; median salaries were most stable at the Associate or less level. See Figure 4.

[^8]Figure 4: Median Salary by Education Level by Year

| \$100,000 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \$90,000 |  |  |  |  |  |  |
| \$80,000 |  |  |  |  |  |  |
| \$70,000 - - - Associate or less |  |  |  |  |  |  |
|  |  |  |  |  |  |  |
| \$50,000 . Master's degree |  |  |  |  |  |  |
| \$40,000 |  |  |  |  |  |  |
| \$30,000 |  |  |  |  |  |  |
| \$20,000 All |  |  |  |  |  |  |
| \$10,000 |  |  |  |  |  |  |
| \$0 $\longrightarrow$ |  |  |  |  |  |  |

About half of the respondents in each year held Bachelor's degrees, with Master's degree as the next most common educational level. Between four and five percent of respondents in each year held either a doctoral or professional degree (e.g., J.D, M.D.). Education levels appear to have increased over time; the percentage of respondents with an Associate degree or less declined each year, from six percent of respondents in 2014, to four percent in 2018.
Table 7: Education Level by Year

|  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Year | Associate or Less | Bachelor's <br> Degree | Master's Degree | Doctoral/ <br> Professional |
| 2014 | $6.4 \%$ | $49.4 \%$ | $39.6 \%$ | $4.6 \%$ |
| 2015 | $5.9 \%$ | $49.1 \%$ | $41.0 \%$ | $4.0 \%$ |
| 2016 | $5.9 \%$ | $49.7 \%$ | $40.4 \%$ | $4.0 \%$ |
| 2017 | $5.4 \%$ | $49.6 \%$ | $40.9 \%$ | $4.1 \%$ |
| 2018 | $4.3 \%$ | $51.5 \%$ | $39.4 \%$ | $4.8 \%$ |

By gender, male respondents were more likely to have post-graduate degrees (Master's or doctoral/professional degrees) than female respondents-about 52 percent of male respondents held Master's or doctoral/professional degrees, compared to about 43 percent of female respondents. The association between gender and education level was statistically significant ( $\left(\mathrm{X}^{2}(3)=101.15, \mathrm{p}<.01\right.$ ), with a small effect size ( $\Phi c=.10$ ), representing a small practical difference in the association between education level and gender. In other words, there is some evidence to suggest that there is a small difference, more than would be expected to occur by chance, between gender and education level, with male respondents more likely to have higher levels of education than females.

Table 8: Education Level by Gender (all years)

|  |  | Education Level |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Year | Associate or Less | Bachelor | Master | Doctoral/ <br> Professional |
| Male | $88(4.2 \%)$ | $909(43.5 \%)$ | $939(44.9 \%)$ | $154(7.4 \%)$ |
| Female | $480(5.9 \%)$ | $4,176(51.6 \%)$ | $3,851(38.9 \%)$ | $288(3.6 \%)$ |

## Position level

Fundraisers who hold high-level positions can expect to earn higher salaries than those in a Program Director, Deputy Director, or Fundraising Officer role. As shown in Table 9, mean and median salaries tended to very across positions. Mean salaries in the "other" category (which included consultants - principal, senior staff, campaign directors; consultants - other; and a general "other" category) were highest across all five years, although the number of respondents in this group was small. The next highest mean salary was for the group representing CEO/CDO/VP/Director of Fundraising ("CEO/etc.").

Table 9: Salary by Position Level (2014-2018)

| Position Level ${ }^{18}$ | Total respondents | Mean Salary | Median Salary |
| :---: | :---: | :---: | :---: |
| CEO, CDO, VP, Director of Fundraising | 5,646 | \$87,287 | \$76,000 |
| Prog. Director/Deputy Director/ Fundraising Officer | 3,349 | \$68,346 | \$61,000 |
| Other Fundraising Position | 1,024 | \$46,592 | \$42,000 |
| Other | 507 | \$93,729 | \$80,000 |

In each year, median salaries were highest for fundraisers in the "other" category, followed closely by those at the CEO/etc. level. Salaries were relatively stable across each year, but tended to be at their lowest points in 2016 for each group (other than CEO/etc.) Median salaries for CEO/etc. were the same in 2014, 2015, and 2016.
Figure 5: Median Salary by Position Level

| \$90,000 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \$80,000 |  |  |  |  |  |  |
| \$70,000 |  |  |  |  |  |  |
| \$60,000 ••••CEO/CDO/VP |  |  |  |  |  |  |
| \$50,000 Prog. Dir./Assoc. Dir./FO |  |  |  |  |  |  |
| \$40,000 - - - - - - - other Fundraising Position |  |  |  |  |  |  |
| \$30,000 - Other |  |  |  |  |  |  |
| \$20,000 - - All respondents |  |  |  |  |  |  |
| \$10,000 |  |  |  |  |  |  |
| \$0 |  |  |  |  |  |  |
|  | 2014 | 2015 | 2016 | 2017 | 2018 |  |

[^9]In each year, with the exception of 2018, over half of respondents reported their current positions as CEO level or CDO, VP, or Director of Fundraising ("CEO/etc."), although the percentage reporting employment at this level declined across each year. See Table 10.
Table 10: Position Type by Responses by Year

| Year | Position Type |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | CEO/CDO/VP/ Director of Fundraising | Program Director/ <br> Deputy Director/ <br> Fundraising Officer | Other Fundraising Position | Other ${ }^{19}$ |
| 2014 | 58.0\% | 28.8\% | 8.4\% | 4.8\% |
| 2015 | 55.6\% | 29.4\% | 10.2\% | 4.8\% |
| 2016 | 53.5\% | 30.2\% | 11.6\% | 4.7\% |
| 2017 | 53.0\% | 30.1\% | 11.2\% | 5.6\% |
| 2018 | 49.4\% | 38.2\% | 7.8\% | 4.7\% |

Male respondents were more likely than female respondents to report current position as CEO, CDO, Vice President, or Director of Fundraising ( 60 percent of male respondents, compared to 52.5 percent of female respondents). ${ }^{20}$

Table 11: Position Type by Gender (2014-2018)

|  | CEO/CDO/VP/ |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Director of |  |  |  |  |
| Gender | Program Director/ <br> Deputy Director/ <br> Fundraising | Other <br> Fundraising <br> Position | Other |  |
| Male | $1,229(59.6 \%)$ | $591(28.0 \%)$ | $130(6.2 \%)$ | $132(6.3 \%)$ |
| Female | $4,298(52.5 \%)$ | $2,658(32.5 \%)$ | $864(10.5 \%)$ | $371(4.5 \%)$ |

While the percentage of female respondents indicating their current position as CEO, CDO, VP, or Director of Fundraising was consistently lower than that of male respondents, this gap may be closing; differences declined to 2 percentage points in 2017 and 5 percentage points in 2018, compared to a high of over ten percentage points in 2015.

[^10]Figure 6: Percentage of Respondents as CEO/CDO/VP/Director of Fundraising

| $64.3 \%$ | $63.7 \%$ | $60.3 \%$ | $54.5 \%$ |
| :---: | :---: | :---: | :---: |
| $56.1 \%$ | $53.4 \%$ | $51.8 \%$ | $53.7 \%$ |
| 2014 |  |  | $48.4 \%$ |

## Presence of one or more negative factors

In each year of the survey, respondents were asked a series of questions on factors that may have negatively impacted their salaries. Negative factors included taking time off to care for children; taking time off to care for other family members; taking time off for further education; and moving to follow a spouse. ${ }^{21}$ Across all years 2014-2018, just under one-quarter (23.5 percent) of respondents had experienced at least one event, and this group tended to have lower mean and median salaries that those who had not experienced any of the events.

Table 12: Presence of One or More Negative Factors (across all years)

|  | Total <br> Experienced at least One Factor? <br> respondents |  |  |  | Mean Salary | Median Salary |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Yes | 2,480 | $\$ 72,938$ | $\$ 64,520$ |  |  |  |
| No | 8,063 | $\$ 79,026$ | $\$ 68,000$ |  |  |  |

While median salaries for those experiencing negative factors were consistently lower than those not experiencing negative factors each year, differences in median salary varied somewhat across years. To illustrate, while median salary difference was just under \$3,000 in 2018, the difference was nearly $\$ 5,500$ in 2017. See Figure 7.
In each year of the survey, about one-quarter of respondents indicated having experienced one or more factors that may have negatively impacted their salary, with the highest percentage of yes responses (those responding yes to at least one factor) occurring in 2017.

[^11]Figure 7: Median Salary by Negative Factor Experience by Year

Table 13: Negative Factors by Year

|  | Response |  |
| :--- | :---: | :---: |
|  | Yes | No |
| 2014 | $23.5 \%$ | $76.5 \%$ |
| 2015 | $23.2 \%$ | $76.8 \%$ |
| 2016 | $23.8 \%$ | $76.2 \%$ |
| 2017 | $\mathbf{2 4 . 9 \%}$ | $75.1 \%$ |
| 2018 | $22.6 \%$ | $77.4 \%$ |

Female respondents were much more likely than male respondents to report experiencing one or more negative factors. As shown in Table 14, while 26 percent of female respondents indicated experiencing one or more negative factors across years, only 15.5 percent of male respondents did. The association between experiencing a negative factor and gender was statistically significant ( $\chi^{2}(1)=96.00, \mathrm{p}<.01$ ), albeit with a small effect size ( $\Phi=-.10$ ).
Table 14: Negative Factors by Gender (all years)

|  | Response |  |
| :--- | :---: | :---: |
|  | Yes | No |
| Gender | $329(15.5 \%)$ | $1,787(84.5 \%)$ |
| Male | $2,108(25.7 \%)$ | $6,096(74.3 \%)$ |
| Female |  |  |

Combining across all years, female respondents were particularly disproportionately represented in the percentage of respondents indicating taking time off to care for children, with 11 percent of female respondents selecting yes to this question, compared to one percent of male respondents. The other negative factor category with larger differences in male/female responses was relocating for a spouse, with nine percent of female respondents indicating that they had done this, compared to four percent of male respondents.

Table 15: Percent of Yes Responses by Factor by Gender

| Negative Factor | Female | Male |
| :--- | :---: | :---: |
| Time off to care for children | $11.2 \%$ | $1.1 \%$ |
| Time off to care for family members | $3.2 \%$ | $1.2 \%$ |
| Time off for further education | $2.9 \%$ | $1.8 \%$ |
| Relocated for spouse | $8.8 \%$ | $4.2 \%$ |
| Resigned prior to having new position | $7.0 \%$ | $9.9 \%$ |

When limiting the chi-square analysis to only the "time off to care for children" factor, across years, the association between gender and taking time off to care for children was statistically significant, ( $\mathrm{X}^{2}(1)=205.05, \mathrm{p}<.01$ ), with a small effect size ( $\Phi=-.14$ ), suggesting a small practical relationship between gender and group membership in this category. In other words, there is some evidence to suggest that there may be a small association, more than would be expected to occur by chance, between gender and taking time off to care for children, with female respondents more likely than males to take time off for children.

Table 16: Taking Time off for Children (by Gender)

|  | Response |  |
| :--- | :---: | :---: |
|  | Yes | No |
| Gender | $329(1.1 \%)$ | $2,092(98.9 \%)$ |
| Male | $918(11.2 \%)$ | $7,286(88.8 \%)$ |
| Female |  |  |

## Years of experience

Years of experience as a fundraising professional is correlated with annual income at statistically significant levels ( $\mathrm{r}=.48, \mathrm{p}<.01$ ). The largest difference in mean salary across all years was in the $15.1-20$ years vs. more than 20 years category, with a difference of nearly $\$ 20,000$. The median salaries of these two groups differed by $\$ 14,000$, but the largest difference in median salary was in the 0-5 years to 5.1 to 10 years groups, with a difference of $\$ 15,000$.
Table 17: Salary by Years of Experience (2014-2018)

| Years of Experience ${ }^{22}$ | Total respondents | Mean Salary | Median Salary |
| :---: | :---: | :---: | :---: |
| 0-5 years | 3,419 | \$55,065 | \$50,000 |
| 5.1-10 years | 2,422 | \$70,871 | \$65,000 |
| 10.1-15 years | 1,649 | \$83,525 | \$78,000 |
| 15.1-20 years | 1,289 | \$95,881 | \$86,000 |
| More than 20 years | 1,602 | \$115,595 | \$100,000 |

Fundraisers with more than 20 years of experience earned the highest median salary across all five years, while those with 0-5 years of experience earned the lowest, with median salaries increasing for every change in category upward. The largest gap between 0-5 years and more than 20 years of experience occurred in 2015 ( $\$ 59,500$ gap), while the gap had closed to $\$ 47,500$ by 2018.

[^12]Figure 8: Median Salary by Years of Experience

## Race/Ethnicity

About nine in 10 survey respondents across all years were White (Caucasian/Non-Hispanic, 90 percent). Across all years, this group had the highest mean salary (\$78,090) of all racial/ethnic groups, while respondents identifying as Asian/Pacific Islander had the highest median salary ( $\$ 72,000$ ). While respondents identifying as Native American or Alaskan Native had the lowest mean and median salary across all years, the number of respondents in this category was very small, totaling only 17 . For racial/ethnic groups with larger numbers, those identifying as multiethnic had the smallest mean salary $(\$ 70,486)$, and those identifying as Hispanic/Latino had the smallest median salary ( $\$ 62,750$ ).
Table 18: Salary by Race (2014-2018)

| Race/Ethnicity ${ }^{23}$ | Total respondents | Mean Salary | Median Salary |
| :---: | :---: | :---: | :---: |
| African American/Black | 256 | \$75,323 | \$65,000 |
| Caucasian/Non-Hispanic | 9,259 | \$78,087 | \$67,000 |
| Asian/Pacific Islander | 159 | \$76,714 | \$72,000 |
| Native American/Alaskan Native | 17 | \$70,009 | \$50,000 |
| Hispanic/Latino | 264 | \$71,307 | \$62,750 |
| Multi-ethnic | 213 | \$70,486 | \$65,000 |
| Other | 82 | \$78,006 | \$69,000 |

As shown in Figure 9, trends in median salaries by race/ethnicity were not consistent, which may be a result of small numbers of respondents in racial/ethnic categories other than Caucasian/Non-Hispanic. To illustrate, while respondents who were Black had the lowest median annual income in 2014 ( $\$ 61,500$ ), the same group had the highest median income in 2015 ( $\$ 69,000$ ). The same is true for the "other" race/ethnicity category-this group had the lowest median income of all groups in 2015 ( $\$ 52,000$ ), but the highest ( $\$ 74,500$ ) in 2016.

[^13]Respondents identifying as Asian had the highest median salary of all racial/ethnic groups in three of the six years (2014, 2017, and 2018).

Figure 9: Median Salary by Racial/Ethnic Group

## Year of response

Respondents' mean and median salaries fluctuated somewhat, but not greatly, across years. Mean salary was the highest in 2017, at $\$ 80,633$, while median salary was the highest in 2018 ( $\$ 68,250$ ). Both mean and median salaries were the lowest in 2016 ( $\$ 74,611$ and $\$ 65,000$ ). Differences in mean and median across years may be a result of income adjusted for inflation or cost of living; differences in respondents across years; or a combination thereof.

Figure 10: Mean and Median Salaries Across Years

| $\begin{aligned} & \$ 90,000 \\ & \$ 80,000 \end{aligned}$ | \$77,095 | \$77,149 | \$74,611 | \$80,633 | \$79,031 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| \$70,000 |  |  |  |  |  |
| \$60,000 | \$67,150 | \$67,000 | \$65,000 | \$69,000 | \$68,250 |
| \$50,000 |  |  |  |  |  |
| \$40,000 |  |  |  |  |  |
| $\$ 30,000$ |  |  |  |  |  |
| \$20,000 |  |  |  |  |  |
| \$10,000 |  |  |  |  |  |
| \$0 | 2014 | 2015 | 2016 | 2017 | 2018 |

## Region

Respondents represented various regions of the United States. ${ }^{24}$ Recognizing that annual income may vary by region, this section identifies differences in mean and median salary by region. ${ }^{25}$ As shown in Table 19, the Southwest region was somewhat underrepresented in responses across years ( 506 total responses, compared to nearly 1,500 or more for other regions). Mean and median salaries in the North Central, South Central, and Southeast were roughly similar across all years, with the Northeast and Northwest having the highest mean and median salaries.
Table 19: Salary by Region (2014-2018)

|  | Total <br> Regpondents |  |  |  | Mean Salary | Median Salary |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| North Central | 2,640 | $\$ 73,723$ |  |  |  |  |
| Northeast | 2,078 | $\$ 64,827$ |  |  |  |  |
| Northwest | 1,742 | $\$ 82,164$ |  |  |  |  |
| South Central | 1,457 | $\$ 70,000$ |  |  |  |  |
| Southeast | 2,070 | $\$ 73,916$ |  |  |  |  |
| Southwest | 506 | $\$ 75,362$ |  |  |  |  |

As shown in Figure 11, there was no clear trend in median salaries across regions across years, although in 2015-2018, the Northwest region was the highest or tied for the highest (tied with Northeast in 2015 and Southwest in 2017). The Northeast region was highest in 2014. The Southwest region showed the most fluctuation in median salary, which is likely a result of the relatively small number of respondents from this region.

Figure 11: Median Salary by Region

[^14]
## Section 2.

## Differences in Other Circumstances and Perceptions

This section discusses additional differences in work circumstances and perceptions for female and male respondents and provides more descriptive detail on differences in organizational size, number of supervisees, and pay raise opportunities and satisfaction with salary negotiation and overall salary and benefits. In addition, the section discusses general work satisfaction and challenges across the past five years. ${ }^{26}$

## Organizational size (Number of fundraising professionals)

Fundraising offices tend to be small. About two-thirds of respondents reported working in organizations with o to 5 full-time equivalent (FTE) fundraising professionals, although the percentage decreased from 2016 to 2018. ${ }^{27}$ While 70 percent of respondents reported working in organizations with 0-5 FTE fundraising professionals in 2016, that had declined to 65 percent in 2018, and the percentage reporting more than 15 in their organization increased from 13 percent to 16 percent.
Table 20: Number of FTE Fundraising Professionals (Percent of Total Respondents)

| Year | Number of FTE Fundraising Professionals |  |  |
| :--- | :---: | :---: | :---: |
|  | o to 5 | $\mathbf{5 . 1}$ to 15 | More than 15 |
| 2016 | $70.2 \%$ | $17.1 \%$ | $12.7 \%$ |
| 2017 | $69.0 \%$ | $18.7 \%$ | $12.3 \%$ |
| 2018 | $64.7 \%$ | $19.6 \%$ | $15.7 \%$ |

Female respondents were more likely than male respondents to indicate working in organizations that employed 5 or fewer full-time equivalent fundraising professionals. ${ }^{28}$
Table 21: Number of FTE Fundraising Professionals by Gender (2016-2018)

| Gender | Number of Supervisees |  |  |
| :--- | :---: | :---: | :---: |
|  | o to 5 | 5.1 to 15 | More than 15 |
| Male | $715(62.8 \%)$ | $241(21.2 \%)$ | $182(16.0 \%)$ |
| Female | $3,296(68.9 \%)$ | $855(17.9 \%)$ | $633(13.2 \%)$ |

Although a larger percentage of female respondents worked in organizations with a small number of fundraising professionals, this percentage trended downward from 2016 to 2018, with a growing percentage of females working in organizations with 5 to 15 FTE fundraising professionals (from 17 percent in 2016 to 19 percent in 2018).

[^15]Figure 12: Respondents in Orgs. with 5 or Fewer Fundraising Professionals by Gender

| $71.5 \%$ | $70.7 \%$ | $65.3 \%$ |  |
| :---: | :---: | :---: | :---: |
| $64.7 \%$ | $61.3 \%$ |  |  |
| 2016 | 2017 | 2018 |  |

## Number of supervisees

Male respondents were more likely than female respondents to report having three or more supervisees. Based on 2018 responses only (the only year in which this question was asked), 27 percent of male respondents reported supervising three or more employees, compared to 22 percent of female respondents. Comparatively, 44 percent of female respondents reported supervising zero employees, while 38.5 of male respondents had zero supervisees. ${ }^{29}$ Additional years of data on this topic may be useful in analyzing patterns in number of supervisees and the extent to which it is related to gender.
Table 22: Number of Supervisees by Gender

|  |  | Number of Supervisees |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Gender | O | 1 to 2 | 3 or more |  |
| Male | $180(38.5 \%)$ | $161(34.5 \%)$ | $126(27.0 \%)$ |  |
| Female | $840(44.4 \%)$ | $637(33.7 \%)$ | $414(21.9 \%)$ |  |

## Satisfaction with salary and benefits package

In general, respondents reported they were satisfied with their salary and benefits packages. Across all years, 76 percent of respondents indicated they were satisfied or very satisfied with their salary and benefits, with an overall mean score of 3.73 (out of a possible 4.00; $4=$ very satisfied; 1 = very dissatisfied). Male respondents were slightly more likely to be satisfied with their salary and benefits than female respondents (mean score of 3.87 versus 3.70). ${ }^{30}$ See Table 23.

[^16]Table 23: Satisfaction by Gender (all years) ${ }^{31}$

|  | Position Type |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Year | Very Satisfied/ <br> Satisfied | Dissatisfied/Very <br> Dissatisfied | Mean Score | Std. Dev. |
| Male | $80.0 \%$ | $20.0 \%$ | 3.87 | 1.14 |
| Female | $75.4 \%$ | $24.6 \%$ | 3.70 | 1.20 |

While each year saw the majority of all respondents satisfied or very satisfied with their salary and benefits package (over three-quarters in all years but 2016), the lowest percentage of all respondents satisfied or very satisfied was in 2016 ( 74 percent). This was also the lowest year for female respondents to agree or strongly agree ( 72 percent), although 79 percent of male respondents agreed or strongly agreed in 2016. The percentage of female respondents indicating that they were very satisfied or satisfied with their salary and benefits package was lower than the percentage of male respondents in each year, with the largest gap occurring in 2018 (83 percent versus 76 percent).
Figure 13: Percent of Respondents Satisfied or Very Satisfied by Year

Across years, roughly similar percentages of male and female respondents reported being satisfied with salary and benefits packages (generally a difference of about three percentage points, with females typically reporting a slightly higher rate of being "somewhat satisfied"); however, males were more likely than females to report being "very satisfied" with salary and benefits packages. Males reported being very satisfied at a rate four percentage points higher than females in 2018 and 8.5 percentage points higher in 2015. See Figure 14.

[^17]Figure 14: Respondents Satisfied and Very Satisfied with Salary/Benefits, by Gender

## Perception of salary negotiation

In any given year, most respondents indicated they had negotiated their salaries effectively, ranging from a low of 58 percent in 2016 (incidentally, the year in which mean and median salaries were the lowest) to a high of 62 percent in 2017.

Table 24: Negotiated Salary Effectively by Year

|  | Response |  |
| :--- | :---: | :---: |
| Year32 | Yes | No |
| 2014 | $59.5 \%$ | $40.5 \%$ |
| 2015 | $59.5 \%$ | $40.5 \%$ |
| 2016 | $57.7 \%$ | $42.3 \%$ |
| 2017 | $62.1 \%$ | $37.9 \%$ |
| 2018 | $61.5 \%$ | $38.5 \%$ |

Male respondents were more likely than female respondents to indicate they effectively negotiated their salaries. Nearly 70 percent of male respondents said yes to this question, compared to just 58 percent of female respondents. The association between gender and feeling that salary was effectively negotiated was statistically significant, $\left(\chi^{2}(1)=96.73, p<.01\right)$, with a small effect size ( $\Phi=-.10$ ), suggesting a small practical association between gender and negotiating salary effectively. In other words, there is some evidence to suggest that there is a small relationship, more than would be expected to occur by chance, between gender and salary negotiation perception, with female respondents less likely to believe they negotiated their salaries effectively.

Table 25: Negotiated Salary Effectively by Gender (all years)

|  | Response |  |
| :--- | :---: | :---: |
| Gender | Yes | No |
| Male | $1,453(69.4 \%)$ | $641(30.6 \%)$ |
| Female | $4,689(57.6 \%)$ | $3,454(42.4 \%)$ |

[^18]
## Pay raise opportunities (based on achieving performance goals)

Overall, less than half of respondents indicated their organization explicitly stated that achieving performance goals would be a factor in determining pay raises, and the portion has decreased over time. Across all five years, just over one-third (35 percent) agreed or strongly agreed this was the case in their organizations, with an overall mean score of 2.83 out of a possible 5.00 ( $5=$ strongly agree; $1=$ strongly disagree). The portion of respondents who agreed or strongly agreed that pay raise opportunities are tied to performance goals dropped from 38 percent in 2014 to just under 30 percent in 2018.

Figure 15: Percent of Respondents Strongly Agreed/Agreed by Year

The mean score of male respondents was slightly higher than that of females combining across all years, ${ }^{33}$ and the percentage of females agreeing or strongly agreeing that their organizations explicitly stated that performance goals and raises were tied together was lower than the percentage of males in each year of the survey. The largest gap was in 2014, when 42.5 percent of males strongly agreed or agreed, compared to 37 percent of females. The lowest levels of agreement for both genders were in 2018, with only 34 percent of males strongly agreeing or agreeing and just 29 percent of females. Across all years, 39 percent of male respondents agreed that their organization explicitly stated the connection between achieving performance goals and raises, compared to 34 percent of female respondents. For this question "neither satisfied nor dissatisfied" was also a choice-across all years, 21 percent of respondents (both male and female) selected this option.

Table 26: Performance and Raise Connection (all years)

|  |  | Position Type |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Strongly <br> Agree/Agree | Disagree/ <br> Strongly Disagree | Mean Score | Std. Dev. |
| Male | $38.5 \%$ | $40.5 \%$ | 2.92 | 1.38 |
| Female | $34.1 \%$ | $44.9 \%$ | 2.80 | 1.35 |

[^19]
## Consideration of changing jobs

Across all years, just under half of respondents (45 percent) had considered seeking other employment in the past 12 months. Although the percentage of female respondents selecting yes to this question was slightly higher than male respondents in all years, the differences were not statistically significant.
Table 27: Considered Other Employment by Gender (all years)

|  |  | Response |  |
| :--- | :---: | :---: | :---: |
|  | Yes | No |  |
| Gender | Yale | $919(44.0 \%)$ |  |
| Female | $3,669(45.3 \%)$ | $1,168(56.0 \%)$ |  |

The percentage of respondents indicating that they had considered changing jobs decreased markedly in 2018, going from about half in 2017 for each gender to about one-third. However, this change may be due to slight changes in the way the question was asked in 2018 versus in prior years (see Appendix B).
Figure 16: Percentage of Respondents Considering Changing Jobs by Gender

Across all years, under one-quarter (23 percent) of respondents had considered looking for a promotion within their organization, roughly the same percentage of male and female respondents ( 18 percent and 24 percent, respectively). ${ }^{34}$ The lack of yes responses across all years may be a result of the number of respondents who are already at the CEO, CDO, VP, or Director of Fundraising levels, who comprised over half of the respondents in each year; lack of opportunities for upward mobility within the organization; or other factors. Further, the differences in percentage of female respondents considering this versus male respondents may be that female respondents tended to be in lower positions than male respondents, and thus may have more opportunity to move upward. See Table 28.

[^20]Table 28: Considered Seeking Promotion by Gender (all years)

|  | Response |  |
| :--- | :---: | :---: |
| Gender | Yes | No |
| Male | $380(18.4 \%)$ | $1,689(81.6 \%)$ |
| Female | $1,909(23.7 \%)$ | $6,136(76.3 \%)$ |

The percentage of respondents seeking a promotion within their organization has been relatively similar across years, with female respondents slightly more likely to say yes. A high of 27 percent of female respondents indicated that they had planned to seek a promotion within their organization in 2016, with a high of 22 percent of male respondents in 2017.
Figure 17: Percentage of Respondents Seeking Promotion by Gender

Respondents were also asked whether they had considered becoming self-employed. Only a very small percentage across years (eight percent) indicated they had, with nine percent of male respondents and eight percent of female respondents indicating yes. ${ }^{35}$
Table 29: Considered Self-Employment by Gender (all years)

|  | Response |  |
| :--- | :---: | :---: |
|  | Yes | No |
| Gender | $185(9.0 \%)$ | $1,860(91.0 \%)$ |
| Male | $603(7.6 \%)$ | $7,347(92.4 \%)$ |
| Female |  |  |

While the highest percentage of females indicating plans for self-employment never exceeded 10 percent (the highest was nine percent in 2016), over 10 percent of males in 2014 and 2016 indicated they had considered self-employment. The percentage of both males and females responding yes decreased to five percent (for each) by 2018. See Figure 18.

[^21]Figure 18: Percentage of Respondents Considering Self-Employment, By Gender

## Reasons for considering changing jobs

Combining data from 2014-2018, the most common reason selected for considering a job change was to get a higher salary, selected by just under half of the respondents ( 45 percent). ${ }^{36}$ The second most common was to advance my career ( 39 percent), followed by frustration with the work environment (31 percent); to seek more challenging work (26 percent); and finding greater opportunities elsewhere (19 percent). These five categories were the top selected in each year (and in that order), with the exception of 2018, and only because the "greater opportunities for career advancement elsewhere" was not listed as a choice. In 2018, "lack of recognition for what I do" took the place of greater opportunities elsewhere, with 17 percent of respondents selecting this factor. The five least commonly selected factors across all years were to spend more time with family; personality conflicts with coworkers or manager; personal values not the same as the organization's; to move closer to family; and gender bias in salary.

While the top five selections for male respondents were the same as those overall, about the same percentages of female respondents selected greater opportunities to work elsewhere (19 percent), as well as unrealistic work expectations (19 percent). In comparison, only 15 percent of male respondents selected unrealistic work expectations. Female respondents were more likely to select "frustrated with work environment" than male respondents-across all five years, 32 percent of female respondents selected this factor, compared to 27 percent of male respondents. Other categories with relatively large differences included to spend more time with family (selected by 13.5 percent of female respondents, compared to 9.5 percent of male respondents), and gender bias in salary (selected by four percent of female respondents, and only 0.2 percent-a total of 4 respondents across all five years-of male respondents). See Table 30.

[^22]Table 30: Reasons for Considering Leaving (all years)

|  | Percent Selecting |  |  |
| :--- | :---: | :---: | :---: |
| Factor | All | Male | Female |
| To earn a higher salary | $44.7 \%$ | $42.8 \%$ | $45.2 \%$ |
| To advance in my career | $38.9 \%$ | $37.9 \%$ | $39.2 \%$ |
| Frustrated with work environment | $31.4 \%$ | $27.4 \%$ | $32.4 \%$ |
| Greater opportunities for advancement elsewhere* | $19.1 \%$ | $18.6 \%$ | $19.3 \%$ |
| To engage in more interesting or challenging work | $26.1 \%$ | $26.2 \%$ | $26.0 \%$ |
| Work expectations are unrealistic | $18.6 \%$ | $15.4 \%$ | $19.4 \%$ |
| Lack a sense of recognition for what I do | $16.5 \%$ | $14.5 \%$ | $17.0 \%$ |
| Work environment is not supportive | $14.9 \%$ | $13.4 \%$ | $15.2 \%$ |
| To spend more time with family | $12.7 \%$ | $9.5 \%$ | $13.5 \%$ |
| Personality conflicts with coworkers/manager | $12.1 \%$ | $9.5 \%$ | $12.8 \%$ |
| Personal values not the same as the organization's | $7.2 \%$ | $6.9 \%$ | $7.2 \%$ |
| To move closer to family | $4.8 \%$ | $6.1 \%$ | $4.4 \%$ |
| Gender bias in salary | $3.5 \%$ | $0.2 \%$ | $4.4 \%$ |

*Note this was not listed as a factor in 2018; response percentages include 2014-2017 only.

## Work challenges

Respondents were asked to identify the factors that are the most likely to prevent them from doing their jobs more professionally. Across all years, by far the most commonly selected factor was insufficient staff personnel, selected by 31 percent of respondents. The next most commonly selected factor was competition from other assigned duties ( 21 percent), followed by insufficient understanding or appreciation of fundraising by the organizational leadership ( 15 percent). ${ }^{37}$

These were also the three most common factors in 2014, 2015, and 2018, generally in that order. In 2016 and 2017, "none" was the third most commonly selected option (this was not a choice offered in 2018). Differences by gender were about the same for most categories, although men were more likely to select "none" than women ( 18.5 percent compared to 13 percent), while women were more likely to select competition from other assigned duties ( 22 percent versus 19 percent) and insufficient staff personnel ( 32 percent versus 29 percent).

Table 31: Factors Preventing Job Execution (all years)3 ${ }^{8}$

| Factor | Percent Selecting |  |  |
| :--- | :---: | :---: | :---: |
|  | All | Male | Female |
| Insufficient staff personnel | $31.2 \%$ | $28.6 \%$ | $31.9 \%$ |
| Competition from other assigned duties | $21.4 \%$ | $18.6 \%$ | $22.2 \%$ |
| Insufficient understanding or appreciation of fundraising by <br> organization leadership | $15.1 \%$ | $15.8 \%$ | $14.9 \%$ |
| None | $14.1 \%$ | $18.5 \%$ | $13.0 \%$ |
| Insufficient authority to exercise professional judgment | $8.0 \%$ | $7.2 \%$ | $8.2 \%$ |
| Insufficient budget for fundraising | $6.6 \%$ | $7.7 \%$ | $6.3 \%$ |
| Insufficient staff training | $3.6 \%$ | $3.6 \%$ | $3.6 \%$ |

${ }^{37}$ Additional categories were added in 2016 and 2018. Categories not appearing in at least four of the five years are excluded, as are responses that selected "other." Additional categories include: insufficient board/leadership engagement in fundraising; insufficient investment in fundraising capacity and technologies; and leadership and others don't understand and value fund development, philanthropy, and accountability (added in 2016), and insufficient collaboration and cooperation among the fundraising staff (added in 2018). A total of 447 respondents did not answer this question.
${ }^{38}$ The question changed in 2018, allowing respondents to select up to three factors, rather than requiring them to select one. To allow for cross-year comparison, the analysis includes only the top-selected factor.

## Overall career satisfaction

Across all years, the vast majority of respondents ( 90 percent) reported they were somewhat or very satisfied with their fundraising career, with an overall mean score of 3.29 out of 4 ( $4=$ very satisfied; 1 = very dissatisfied). In all years but 2018, at least 91 percent of respondents indicated satisfaction; in 2018, 89 percent of respondents did. Less than one percent of respondents indicated that they were very dissatisfied.

Figure 19: Percent of Respondents Somewhat or Very Satisfied (all years)

Although levels of satisfaction were high for all respondents, male respondents in each year tended to be slightly more likely to be somewhat or very satisfied with their fundraising careers, with an overall mean score of 3.35 , compared to 3.28 for females ${ }^{39}$. While differences were relatively small across years, the biggest differences occurred in 2014, with 94 percent of males indicating satisfaction, compared to 91 percent of females, and 2018, with 91 percent of male respondents satisfied with their careers, compared to 89 percent of females.

Table 32: Performance and Raise Connection (all years)

|  | Position Type |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Year | Somewhat/Very <br> Satisfied | Somewhat/Very <br> Dissatisfied | Mean Score | Std. Dev. |
| Male | $92.7 \%$ | $7.3 \%$ | 3.35 | .631 |
| Female | $90.6 \%$ | $9.4 \%$ | 3.28 | .650 |

[^23]
## Section 3. Conclusion

Although fundraising (and non-profit employment in general) tends to be predominantly female, the differences in salary for fundraising professionals participating in this survey tends to align with literature on salary differences by gender (with wage advantages for males) even in professions dominated by women. $4^{0}$

## In other words, the fundraising field has work to do to close gaps in salary attributable to gender alone.

While it may be unsurprising that fundraising salaries are higher at very large organizations, for high-level positions, and for fundraisers with advanced degrees, the fact that gender contributed to a 10 percent decrease in salary for women is not trivial. Gender contributed to the model more than organizational budget size of $\$ 1-\$ 3$ million (compared to organizational budget size of less than $\$ 1$ million), more than holding a Master's degree (compared to a Bachelor's degree), and more than having experienced one or more negative factors (compared to not). More women than men take time off for childcare, a smaller proportion hold high-level positions, and a smaller proportion hold fundraising positions in the largest organizations.

## Still, independent of these and other variables, the profession is faced with the reality that women in fundraising are paid less than men.

The steps required to remedy this disparity are beyond the scope of this report; however, awareness of the data, acknowledgement of the responsibility within the profession and among hiring managers to close gender-based gaps, and an active commitment to equity may shift the culture in fundraising and result in differences in pay based only on differences in merit.

## Appendix A: Methodology

This report utilizes both descriptive and inferential statistics to identify relationships in the survey data, using data collected by AFP from 2014-2018. The full dataset was 11,889. As detailed in the body of the report, because the main focus of the analysis was related to annual income, and annual income varies greatly for those not employed full time (defined for this report as 75 percent FTE or higher), respondents who indicated less than full time employment were excluded from the study, accounting for 757 records). Additionally, 499 records were excluded where employment FTE was left blank (not reported), resulting in 10,633 records, and five records were eliminated where salary was determined to be an extreme outlier (salary reported was greater than $\$ 1,000,000$ ), resulting in 10,628 .

After further analysis, for the first section of the report which focused on annual income, further exclusions were those missing salary data or with annual incomes less than \$10,000. In analyses focused on gender (the linear regression, as well as analyses of group differences based on gender), only respondents that selected male or female were included (because additional gender categories were not added until 2018), resulting in 308 responses excluded. In addition, for each analysis throughout the report, blank responses were excluded (e.g., for education level, respondents that did not report their education level were excluded).

## Statistical Analysis

Descriptive analysis, linear regression (with annual income, the outcome variable, transformed to the natural log), chi-square, and ANOVA were used to analyze variables that predict annual income (regression); differences in group membership (chi-square); and differences in mean scores on Likert scales (ANOVA). IBM SPSS Statistics was used for all statistical analyses. More detail is provided about the linear regression below. Contingency tables for chi-square analyses are provided in the report, as are chi-square statistics, $F$ values, and effect sizes for the ANOVA and chi-square analyses. Complete results of the linear regression (slope, standard error, and standardized beta weights) are provided in the next section.

## Linear Regression

Linear regression was performed to analyze the extent to which selected variables contribute to predicting annual income, including years of experience as a fundraising professional, organizational budget, current position, gender, region, year in which the survey was completed, race/ethnicity, education level, and whether the respondent had experienced any factors that might negatively contribute to income, when all other predictor variables are controlled. Effect sizes (standardized beta weights and the natural log transformed) were also computed, which helped substantiate any statistically significant results.

The report authors engaged in model through sensitivity tests to determine which predictor variables should be included in the model, best model fit, sample size restrictions, etc. These were done to ensure that substantial multicollinearity, lack of homoscedasticity, or other issues common in regression analyses did not occur. Preliminary analyses also investigated whether possible interactions should be included. As might be expected, most of these did not substantially improve model fit due to the typical low power of interaction effects. Exploratory
tests also were used to check if the addition/deletion of variables might improve model fit, if some of the variables had high standard errors.

The general model for the linear regression was:

$$
(\mathrm{P})=\beta_{0}+\beta_{1}\left(\text { Covariate }_{\mathrm{i}}\right) \ldots+\beta_{\mathrm{x}}\left(\text { CovariateX }_{\mathrm{i}}\right)
$$

where:

- (P) is the predicted log of annual income given the values of the constant and covariates in the model.
- $\beta_{0}$ is the constant (i.e., intercept) in the model
- $\beta_{1}$ (Covariate) ... $\beta_{\mathrm{x}}$ (CovariateX $\mathrm{X}_{\mathrm{i}}$ ) are the covariates (predictors) in the model

Summary of Linear Regression Analysis

|  |  |  |  |
| :--- | :---: | :---: | :---: |
|  |  |  |  |
|  |  |  |  |
| Predictor Variable |  |  |  |
|  |  |  |  |
| Gender (female, compared to male) |  |  |  |
| Race (nonwhite, compared to white) | -0.11 | 0.01 | $0.89^{*}$ |
| Negative impact (any, compared to none) | 0.00 | 0.01 | 1.00 |
| Years of experience | -0.06 | 0.01 | $0.94^{*}$ |
| Year of the survey | 0.02 | 0.00 | $1.02^{*}$ |
| Org budget (\$50 mill. or more, compared to <\$1 million) | -0.01 | 0.00 | $0.99^{*}$ |
| Org budget (\$10-49.9 mill., compared to <1 million) | 0.43 | 0.01 | $1.54^{*}$ |
| Org. budget (\$3-9.9 mill., compared to <1 million) | 0.27 | 0.01 | $1.1^{*}$ |
| Org budget \$1-2.9 mill. (compared to <1 million) | 0.17 | 0.01 | $1.18^{*}$ |
| Region - Northeast (compared to North Central) | 0.07 | 0.01 | $1.07^{*}$ |
| Region - Northwest (compared to North Central) | 0.04 | 0.01 | $1.04^{*}$ |
| Region - South Central (compared to North Central) | 0.12 | 0.01 | $1.12^{*}$ |
| Region - Southeast (compared to North Central) | 0.01 | 0.01 | 1.01 |
| Region - Southwest (compared to North Central) | 0.02 | 0.01 | 1.02 |
| Current position (CEO, CDO, VP, Director of Fundraising <br> compared to Prog. Dir./Dep. Dir/Fundraising Officer) | 0.07 | 0.02 | $1.07^{*}$ |
| Current position (Other Fundraising Position, compared to <br> Prog. Dir./Dep. Dir./Fundraising Officer) | 0.22 | 0.01 | $1.25^{*}$ |
| Educ. level (doctoral or prof. degree, compared to Bach.) | -0.23 | 0.01 | $0.80^{*}$ |

| Educ. level (< Bach., compared to Bach.) | 0.06 | 0.01 | $1.06^{*}$ |
| R |  | -0.06 | 0.02 |
| $1.15^{*}$ |  |  |  |

$\mathrm{R}=.705$; R2 (adj) =.496. B=slope, $S E \mathrm{~B}=$ standard error, and $\beta=$ standardized beta.
*p<. 01

## Limitations

## Selection Bias

Selection bias is common in any form of design that does not involve random sampling or random assignment. While the survey results encompass five years of data and are generally representative of the membership of the Association of Fundraising Professionals (AFP), the survey data nevertheless represent only those who are members of AFP, as well as those who elected to respond to the survey each year. The survey was not a result of statistical sampling or
random selection of participants; as such, it is possible that those who elected to respond to the survey are not necessarily representative of the fundraising profession as a whole, as selection bias may distort inferences to the larger population. ${ }^{11}$

## Claims of Causality

No variables were manipulated in this study (i.e., there were no "treatment" and "control" groups); as such, no claims of causation can be made. Statistical analyses included in this report, including multivariate regression, chi square, and ANOVA, should not be interpreted to represent causality, merely correlations or descriptions of differences in means or group membership. In other words, one variable should not be interpreted as "causing" another variable (e.g., being female does not necessarily cause one to have a lower salary; instead, it should be interpreted as a variable that is related to predicting annual income).

## Omitted Variable Bias

While the AFP survey asks a number of comprehensive questions about being a fundraising professional, and available variables that may be related to annual income were included in the regression analysis, not all variables that might additionally account for variance in the model could be included due to availability of the data. In fact, it is likely impossible to create a viable survey that could include all variables that may be related to annual income. Further, some variables were omitted due to relationships with other existing variables. For example, age was excluded from the regression model, although it was available in the data, because of its high correlations to other variables in the model. The exclusion of this (or other) variables may potentially allow characteristics correlated with the variable(s) to appear statistically significant when they are not. However, the authors of this report took care in planning, clarifying and communicating the model selected (see below for more details on model selection).

## Selection of Statistical Models

Each model comes with its own limitations, and it must be explicitly understood that any statistical model selected is an approximation of reality. Results and conclusions drawn should be interpreted with caution. Precise limitations may vary by study, design, and method, but general advice for interpreting statistical results is that the results should be seen only as evidence toward the existence of a particular phenomenon and should not be concluded to be factual. Rather, findings should be seen as probabilistic under the modeling assumptions. Moreover, the quality of evidence supporting statistical hypotheses mirrors that of the design, data collection, data caliber, and data analysis. Finally, omitted variables (those omitted due to lack of availability or other reasons) may inadvertently contribute to limited statistical results (see above related to omitted variable bias). As previously noted, the team took care in selecting the regression model chosen to maximize the internal validity of the analysis. Further, sensitivity tests in the model development process were used to find the best probably model, given the data available.

## Outliers and Eliminated Data Points

The full data set of the AFP survey was not used. For example, only those reporting genders of male or female were included in the study. Further, annual income data points that were determined to be extreme outliers (e.g., income of less than \$10,000 for full-time employed

[^25]respondents, or income of greater than $\$ 1,000,000$ ) were excluded from the regression analysis.
The numbers and instances of excluded cases are indicated throughout the report.

## Self-reported Data

Data in the AFP survey is self-reported by fundraising professionals and does not represent administrative data. Therefore, the analysis included in this report is reliant on the extent to which respondents self-reported information accurately.

## Appendix B: Relevant Survey Questions ${ }^{42}$

## Full-Time Equivalency (FTE)

What is the Full-Time Equivalency (FTE) of your current position?
1-24\%
25-49\%
50-74\%
75-99\%
100\%

## Annual Income

What was your annual professional income during the last fiscal year?
(excluding fringes and perquisites or any bonus)

## Gender

What is your gender? (NOTE: In 2018, additional choices were added: transgender man; transgender woman; gender non-conforming; intersex or other related term; prefer not to say; prefer to selfdescribe).
Male
Female

## Education Level

What is your highest level of educational attainment? (NOTE: In 2018, some college work; post-graduate work; MBA; and MNA were eliminated, and other Master's degree was changed to Master's degree
Professional degree was changed to other advanced degree (JD, MD, DO, etc.), and a general "other" category was added).
High school diploma or equivalent
Some college work (no degree)
Associate degree
Baccalaureate degree
Post-graduate work (no degree)
MBA
MNA (Master of Nonprofit Administration)
Other Master's degree
Professional degree (law, medicine, etc.)
Doctoral degree

## Years of Experience

For how many years have you been employed as a fundraising professional? (open-ended question)

## Position Level

What is your current position? Please select the ONE choice that best describes the full scope or range of your responsibilities, even if it is not your exact title. (NOTE: In 2018, Vice Chancellor was added to the second option; Associate Vice Chancellor and Associate Vice President was added to the third option; Fundraising Officer was added as an answer choice; and Consultant - Other was split into Consultant staff member at full-service firm but not principal or senior; and Consultant - specialized, independent, or small-shop consultancy).
Agency CEO with Fundraising and Other Responsibilities

[^26]Chief Development Officer, Vice President or Director of Development, Fundraising or
Institutional Relations (top paid position with responsibility for managing fundraising)
Deputy Director/Associate Director or equivalent (number two person with responsibility for managing fundraising)
Program Director/Manager (with responsibility for managing a particular program(s) e.g., annual giving, planned giving)
Other Fundraising Staff Position (e.g., coordinator, assistant, researcher, writer)
Consultant - Principal, Senior Staff member, Campaign Director in Full Service Firm
(surveys, planning, organization, campaign direction, etc.)
Consultant - Other Position in Full Service Firm
Other
None (unemployed)

## Race/Ethnicity

What is the main ethnic background you identify with? (NOTE: In 2018, a large number of additional categories were added to race/ethnicity, including Chinese, Hawaiian, Indian, Sri Lankan, Pakistani, or Bangladeshi; Filipino; Japanese; Korean; Middle Eastern, North African, or Arab; Pacific Islander Samoan; Southeast Asian; and West Asian).
African American
Caucasian, not of Hispanic Origin
Asian or Pacific Islander
Alaskan Native
Hispanic/Latino
Native American
Multi-Ethnic
Other

## Organizational Budget

What was your organization's annual operating budget during the last fiscal year? (NOTE: In 2018, more than $\$ 75$ million was eliminated, and choices of $\$ 75$ million - $\$ 100$ million; more than $\$ 100$ million; and don't know were added).

Less than \$250,000
\$250,000-\$499,999
\$500,000-\$999,999
\$1,000,000-\$2,999,999
\$3,000,000-\$4,999,999
\$5,000,000-\$9,999,999
\$10,000,000-\$49,999,999
\$50,000,000-\$74,999,999
More than $\$ 75$ million

## Region

In what region is the office where you work located?
Northeast U.S.: Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont
Southeast U.S.: Alabama, District of Columbia, Florida, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, West Virginia
North Central U.S.: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Nebraska, North Dakota, Ohio, South Dakota, Wisconsin
South Central U.S.: Arkansas, Louisiana, Missouri, Oklahoma, Texas
Northwest U.S.: Alaska, California, Hawaii, Idaho, Montana, Oregon, Utah, Washington, Wyoming

Southwest U.S.: Arizona, Colorado, Nevada, New Mexico
Other U.S.
Non-U.S.

## Presence of One or More Negative Factors

Have any of the following had a negative impact on your earnings potential?
I took time off from my career to stay home and raise children.
I took time off from my career to take care of family members.
I took time off from my career to further my education.
I have resigned from previous positions because I moved to other cities to follow my spouse's/partner's career.
I have resigned from a previous position before being offered a new position.
Other (please specify)

## Organizational Size (Number of Fundraising Professionals)

How many FTE fundraising professionals work in your organization? (open-ended)

## Number of Supervisees

For fundraising work in your current job, how many other people do you manage or supervise? O

$$
1-2
$$

3 or more

## Satisfaction with Salary and Benefits Package

Overall, how do you feel about your salary and benefits package? (NOTE: Prior to 2018, this question was asked as a standalone question. In 2018, it was listed as part of a matrix of choices under the question "Please indicate the extent to which you are satisfied with your job and career." No opinion was not listed as a choice).
Very Satisfied
Somewhat Satisfied
Somewhat Dissatisfied
Very Dissatisfied
No Opinion

## Perception of Salary Negotiation

Do you feel that you negotiated effectively for the salary you wanted when you accepted your current position?
Yes
No

## Pay Raise Opportunities (Based on Performance Goals)

My organization explicitly states that achieving determined performance goals will be a factor in determining a pay raise.
Strongly Agree
Agree
Neutral
Disagree
Strongly Disagree

## Consideration of Changing Jobs

In the past 12 months, select any of the following that you have done: (NOTE: In 2018, "made efforts to leave consulting and seek employment at an organization" and "none of these" were added as choices).

Looked for a promotion within your current organization.
Looked for a job with another employer.
Made plans to become self-employed.

## Reasons for Considering Changing Jobs

If you have thought about leaving your organization in the past year, please indicate all of the reasons why. (NOTE: Three choices were added in 2018 - because I plan to retire; to obtain health, retirement, or leave benefits more suited to my (or my family's) needs; and other. In addition, because there are greater opportunities for career advancement elsewhere was eliminated in 2018).
To earn a higher salary
To advance in my career, to seek a position with more responsibility and/or authority
To engage in more interesting or challenging work
Because I lack a sense of recognition for what I do
Because work expectations are unrealistic
Because my work environment is not supportive of me as an individual
Because there are greater opportunities for career advancement elsewhere
Because I am frustrated by the work environment
To get more time to spend on personal/family activities
Because of personality conflicts with my coworker(s) or manager
Because my values and the organization's values are not the same
To move closer to family members
Because of gender bias in terms of salary

## Work Challenges

What is the most important factor in your organization that prevents you from doing your job more professionally? (Choose only ONE.) (NOTE: Prior to 2018, respondents were instructed to select only one factor. However, in 2018 they were given the option of choosing up to three. Choices added in 2016 were insufficient board/leadership engagement in fundraising; insufficient investment in fundraising capacity; and leadership and others don't understand and value fund development...; and insufficient collaboration and cooperation among the fundraising staff was added in 2018).
None
Insufficient staff personnel
Insufficient staff training
Insufficient budget for fundraising
Insufficient understanding or appreciation of fundraising by organization leadership.
Competition from other assigned duties
Insufficient authority to exercise professional judgment
Insufficient board/leadership engagement in fundraising
Insufficient investment in fundraising capacity \& technologies
Leadership and others don't understand and value fund development, philanthropy and accountability
Other

## Overall Career Satisfaction

Please indicate your degree of satisfaction with the following aspects of your work (NOTE: This question response was used for analysis of overall career satisfaction in this report but is listed in the survey as one of a series of components related to work. Only this component was used for this report)

|  | Very satisfied | Somewhat satisfied | Somewhat Dissatisfied | Very dissatisfied |
| :---: | :---: | :---: | :---: | :---: |
| My fundraising career overall | $\square$ | $\square$ | $\square$ | $\square$ |

## Appendix C: Descriptive Data Tables

## Section 1 Descriptive Data

The following tables provide data on mean and median salaries, number of respondents, and standard deviation, by gender, for predictor variables analyzed in the linear regression and discussed in Section 1 of the report. The tables include only those respondents who were at least 75 percent FTE and reported salary and excludes those with outlier salaries. Note that, while analyses in the report focused on gender excluded those not reporting gender or reporting a gender other than male or female, the tables in Appendix C include those respondents.
Salary by Gender and Year of Response

| Year |  | Mean | N | Std. <br> Deviation | Median |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2014 | Not reported | \$78,079 | 19 | 39,017 | \$69,000 |

## Section 2 Descriptive Data

This section provides data tables for components described in Section 2, including number of fundraising professionals; number of supervisees; satisfaction with salary and benefits package, and perception of salary negotiation; pay raise opportunities for meeting performance goals; reasons for considering job changes; work challenges; and overall career satisfaction. The tables are organized by year and gender. Note that, while Section 2 focused only on respondents who reported male or female gender and excluded others (blanks or reporting other genders), this section includes all gender types, as well as those missing gender.
Organizational Size by Gender (Number of Fundraising Professionals)

| Year | Gender | Number of Fundraising Professionals |  |  |  |  |  | Total |

    ${ }^{8}$ Mesch, D. J., \& Rooney, P. M. (2008). Determinants of compensation: A study of pay, performance, and gender differences for fundraising professionals. Nonprofit management and Leadership, 18(4), 435463.

[^3]:    ${ }_{9}$ To address skewness, annual income was transformed into the natural $\log (\mathrm{Ln})$, a common practice when income is used in a linear regression model. For the regression analysis, in addition to the 55 responses that were excluded due to missing annual income or income greater than \$1,000,000, an additional 35 cases were excluded due to reporting income of o or income less than \$10,000.

[^4]:    ${ }^{10}$ Predictor variables that contributed less than five percent to income differences are not listed in the table. Those include years as a fundraising professional, race, year of survey, and holding less than a Bachelor's degree. In addition, while some regional categories contributed to annual income differences at a statistically significant level, regional differences are excluded from the table, as regional differences were included as a control variable but can be attributed to differences in costs of living across various areas. Full results of the linear regression, including all variables, are provided in Appendix A.

[^5]:    ${ }^{11}$ Only respondents who reported employment at 75 percent FTE or higher were included, to approximate full-time employment. This resulted in 757 cases being excluded from this report for indicating FTE of less than $75 \%$, as well as an additional 504 excluded because FTE was not reported. In initial review of the data, an additional five cases were excluded for having extreme outlier salaries ( $>\$ 1$ million), for a total of 10,628 records.

[^6]:    ${ }^{12}$ In 2018, additional gender categories were added. 241 of the cases in 2018 were unknown (gender unreported), and 10 cases reported a gender other than male or female. For analyses in this report that focus on gender (salary by gender; group membership; and the linear regression), only those whose gender was not blank, or whose gender was reported as male or female, are included.
    ${ }^{13}$ In addition to the 5 removed during initial data review, an additional 35 were excluded from salary analyses because reported salary was o or less than $\$ 10,000$.

[^7]:    ${ }^{14}$ A total of 571 responses were excluded due to not reporting organizational budget.
    15 The association between gender and position level was statistically significant ( $X^{2}(4)=61.09, p<.01$ ); however, the effect size was negligible ( $\Phi \subset=.08$ ). Because no real effect size was detected, there is not necessarily evidence to suggest that there is an association between gender and position level; the statistically significant result may be due to sample size.
    ${ }^{16}$ Throughout the report, chi square tests $\left(\chi^{2}\right)$ were conducted to compare the frequency of different components, such as organizational budget and education level, among the two gender groups and to test if group membership and the components were related at statistically significant levels (i.e., not independent). Effect sizes (phi ( $\Phi$ ) or Cohen's v ( $\Phi c$ )) were also computed, to measure the magnitude of difference and to help substantiate any statistically significant results. Effect size is necessary to understand if a statistically significant difference between groups is also practically relevant. Because chisquare tests are particularly sensitive to sample size, a large sample may show a statistically significant

[^8]:    association between group membership and a variable, but the practical association may be small or negligible. (Bollen, K.A. (1989). Structural equations with latent variables. New York: Wiley).
    ${ }^{17}$ In 2018, the education level categories changed. As such, some data points from prior years were combined into 2018 categories. Associate or less includes individuals who selected (in 2014-2017) some college, no degree; associate degree; or high school diploma. Master's degree includes individuals who selected (in 2014-2017) MBA, MNA, and post-graduate work. Doctoral/professional degree includes individuals who selected doctoral degree or professional degree. 69 total respondents selected "other" for education level, which was excluded from the analysis. 285 cases were excluded from the analysis due to not reporting education level.

[^9]:    ${ }^{18}$ To facilitate the linear regression analysis, positions were grouped together (CEO with CDO, VP, and Director of Fundraising; Program Director/Manager with Deputy Director/Associate Director and Fundraising Officer (added in 2018); and Consultant and Other). Note Consultant and Other (the Other category in the table) were not included in the linear regression, due to sample size and goodness of fit for the model. Nine cases were excluded from the analysis due to not reporting current position.

[^10]:    ${ }^{19}$ For goodness of fit in the regression model, this group was excluded from the regression analysis. This group includes consultant - principal, sr. staff, campaign director; consultant - other; or other. ${ }^{20}$ The association between gender and position level was statistically significant ( $\left.\chi^{2}(3)=70.26, p<.01\right)$; however, the effect size was negligible ( $\Phi c=.08$ ). As there was no real effect size detected, there is no real evidence to suggest that there is an association between gender and position level, and the statistically significant result may be due to sample size.

[^11]:    ${ }^{21}$ An "other" question was also asked, with open-ended responses, but for the purpose of this report, "other" responses were excluded from the analysis.

[^12]:    ${ }^{22}$ Years of experience as a fundraising professional was reported in the survey as a number and converted to a category for this report. 162 cases were excluded from the analysis due to missing responses.

[^13]:    ${ }^{23}$ No persons identifying as Native American or Alaskan Native responded to the survey in 2015. A total of 293 cases were excluded from the analysis due to not reporting race/ethnicity.

[^14]:    ${ }^{24}$ Respondents selecting "other" or "non-US" are excluded from both the descriptive analysis above and the regression analysis, due to small sample size ( 35 total and 1 total, respectively, 2014-2018). An additional 14 responses were excluded due to not reporting region.
    ${ }^{25}$ Appendix B lists the states included in each region.

[^15]:    ${ }^{26}$ The analyses in this section are limited to individuals who reported male or female for gender; blank responses and other gender selections are excluded, for the purposes of multi-year analysis. Full data (including other genders and missing responses) can be found in Appendix C.
    ${ }^{27}$ While questions were asked about a variety of employee types in surveys conducted in 2014 and 2015, the key question asked in 2016-2018 was about the number of full-time equivalent (FTE) fundraising professionals, as opposed to overall organizational size. Thus, this section focuses on the FTE number of fundraising professionals, rather than overall organizational size. 195 responses were excluded because the question was not answered.
    ${ }^{28}$ The association between gender and organizational size was statistically significant $\left(\chi^{2}(2)=15.52\right.$, $\mathrm{p}<.01$ ), although the effect size was negligible ( $\Phi c=.05$ ), indicating that the differences in group membership are not meaningful; the statistically significant result may be due to large sample size.

[^16]:    ${ }^{29}$ The association between gender and number of supervisees (the category selected) was statistically significant ( $\mathrm{X}^{2}(2)=7.29, \mathrm{p}<.05$ ), the effect size was negligible ( $\Phi c=.06$ ), indicating no meaningful association between gender and number of supervisees. Three responses were excluded from the analysis due to not answering the question.
    ${ }^{30}$ Although differences in satisfaction were statistically significant by gender $(\mathrm{F}(1,10219)=34.02, \mathrm{p}<.01)$, the effect size was negligible ( $\eta^{2}=.06$ ), indicating that statistical significance may be a result of large sample size and that likely there are no practical or meaningful differences in satisfaction by gender.

[^17]:    ${ }^{31}$ Responses of "no opinion" or those not responding at all were excluded from the analysis and are not included in the denominator for percentages, because this was not an answer choice for the 2018 survey. A total of 225 responses were excluded due to not answering the question, and 33 were excluded for selecting "no opinion."

[^18]:    ${ }^{32}$ A total of 112 responses were excluded due to not answering the question.

[^19]:    33 Mean score differences were statistically significant $(\mathrm{F}(1,10199)=22.85, \mathrm{p}<.01)$ but effect size was negligible ( $\eta^{2}=.002$ ), suggesting that statistical significance may be result of large sample size and that evidence does not support that there were meaningful differences between genders. 145 responses were excluded due to not answering the question.

[^20]:    34 Although the difference in male and female respondents indicating they had considered looking for a promotion was statistically significant $\left(\left(\chi^{2}(1)=27.03, \mathrm{p}<.01\right)\right.$, the effect size is negligible ( $\Phi=.05$ ), suggesting that evidence does not support that there is a meaningful association between gender and seeking promotion, and that the statistically significant result may be due to sample size.

[^21]:    ${ }_{35}$ Differences were not statistically significant at $\mathrm{p}<01$.

[^22]:    ${ }^{36}$ Additional categories were added in 2018: Plan to retire; To attain better benefits; and Other. Those categories are excluded from this analysis.

[^23]:    39 While the mean score differences were statistically significant $(\mathrm{F}(1,10216)=\mathbf{2 4 . 5 0}, \mathrm{p}<.01)$ effect size was negligible ( $\eta^{2}=.002$ ), suggesting that evidence does not support a claim that there are meaningful differences between genders. 298 responses were excluded due to non-response.
